

Fig. 1

FIG. 2 is a block diagram of a system for processing travel requests. The system includes a PNR (Passenger Name Record) from GDS (Global Distribution System) input, an Adapter (210), a PNR to Travel Request Converter (220), and a Travel Request Preprocessor. The Adapter (210) receives the PNR from GDS and outputs PNRs via XML, CORBA, or EJB to the PNR to Travel Request Converter (220). The PNR to Travel Request Converter (220) then outputs Travel Requests to the Travel Request Preprocessor.
